

# design visualization

The design process required to remodel or build a new home is very exciting for a homeowner. However, it can become stressful without a clear understanding of the plans that will soon become your home.

With this in mind, GMK incorporates the latest 3-dimensional visualization technologies, not only as a design tool, but also as a communication tool. As the design develops, you see computer models of your home's interior and exterior, which these examples show, are nearly indistinguishable from photographs of the completed project.

GMK feels it is unreasonable to expect clients to visualize 3-dimensional buildings with presentations limited to 2-dimensional drawings. Clear communication of ideas throughout the design process is essential for it's success. This philosophy allows the process to be fun and exciting for everyone involved. You and your family deserve to understand the design of your home, every step of the way.
